

Calming Cuddle Blanket

Calming cuddle blankets provide enough pressure for input and the 4 sections keep too much weight from being placed on the baby.

Important Reasons For Sensory Support

- Sensory input helps to support physiological stability - consistent and appropriate tactile/pressure on the baby can provide positive experiences in the skin receptors.
- Sensory support assists neuromuscular development - appropriate pressure can assist with maintaining the preferred flexion position
- Sensory input assists with self-soothing
- Sensory input assists with behavioral organization - because, appropriate pressure is calming
- Sensory input supports containment which influences sleep - sleep supports weight gain - weight gain supports more energy for nipple feeding
